# Lập trình mạng Các giao thức mạng FTP – SMTP - HTTP

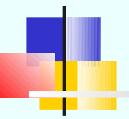

Giảng viên: **TS. Nguyễn Mạnh Hùng** Học viện Công nghệ Bưu chính Viễn thông (PTIT)

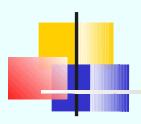

# Nội dung

- Giao thức FTP
- Giao thức SMTP
- Giao thức HTTP
- Bài tập

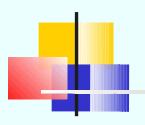

#### Giao thức FTP

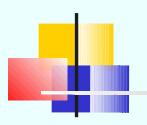

# FTP: kết nối đến server

```
import org.apache.commons.net.ftp.FTPClient;
import java.io.IOException;
public class FtpConnectDemo {
  public static void main(String[] args) {
    FTPClient client = new FTPClient();
    client.connect("ftp.domain.com");
    boolean login = client.login("admin", "secret");
    if (login) {
      System.out.println("Login success...");
      boolean logout = client.logout();
      if (logout) {
        System.out.println("Logout from FTP server...");
    } else {
      System.out.println("Login fail...");
    client.disconnect();
```

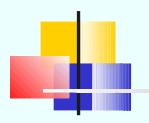

#### FTP: download file

```
import org.apache.commons.net.ftp.FTPClient;
import java.io.IOException;
import java.io.FileOutputStream;
public class Main {
  public static void main(String[] args) {
    FTPClient client = new FTPClient();
    FileOutputStream fos = null;
    client.connect("ftp.domain.com");
    client.login("admin", "secret");
    String filename = "sitemap.xml";
    fos = new FileOutputStream(filename);
    client.retrieveFile("/" + filename, fos);
    fos.close();
    client.disconnect();
```

#### FTP: upload file

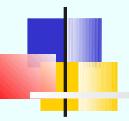

```
import org.apache.commons.net.ftp.FTPClient;
import java.io.FileInputStream;
import java.io.IOException;
public class Main {
  public static void main(String[] args) {
    FTPClient client = new FTPClient();
    FileInputStream fis = null;
    client.connect("ftp.domain.com");
    client.login("admin", "secret");
    String filename = "Touch.dat";
    fis = new FileInputStream(filename);
    client.storeFile(filename, fis);
    client.logout();
    fis.close();
```

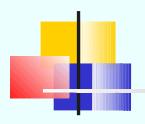

### Bài tập

Cài đặt theo mô hình giao thức FTP cho bài toán:

- Download file t
   ù
   server
- Code theo mô hình MVC
- Client nhập tên file download và tên thư mục cần lưu file từ người dùng

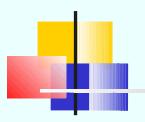

#### Giao thức SMTP

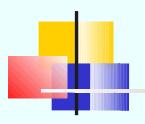

#### SMTP: send mail (1)

```
// Get system properties
Properties props = System.getProperties();
// Setup mail server
props.put("mail.smtp.host", "hostname");
// Get session
Session session = Session.getDefaultInstance(props, null);
// Define message
MimeMessage message = new MimeMessage(session);
message.setFrom(new InternetAddress(from));
message.addRecipient(Message.RecipientType.TO,
   new InternetAddress(to));
message.setSubject("The Subject");
message.setText("The Message");
// Send message
Transport.send(message);
```

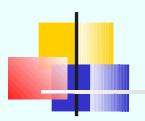

#### SMTP: send mail (2)

# SMTP: get mail (1)

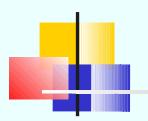

```
// Create empty properties
Properties props = new Properties();
// Get session
Session session = Session.getDefaultInstance(props, null);
// Get the store
Store store = session.getStore("pop3");
store.connect(host, username, password);
// Get folder
Folder folder = store.getFolder("INBOX");
folder.open(Folder.READ ONLY);
BufferedReader reader = new
       BufferedReader(new InputStreamReader(System.in));
```

# SMTP: get mail (2)

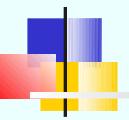

```
// Get directory
Message message[] = folder.getMessages();
for (int i = 0, n = message.length; i < n; i++) {
    System.out.println(i + ": " + message[i].getFrom()[0] + "\t" + message[i].getSubject());

    System.out.println("Read message? [YES to read/QUIT to end]");
    String line = reader.readLine();
    if ("YES".equalsIgnoreCase(line)) {
        System.out.println(message[i].getContent());
    } else if ("QUIT".equalsIgnoreCase(line)) {
        break;
    }
}</pre>
```

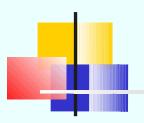

# Bài tập

Cài đặt đầy đủ theo mô hình giao thức SMTP cho ví dụ trong bài

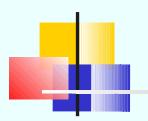

#### Giao thức HTTP

### HTTP: đọc nội dung web

```
URL page = new URL(address);
StringBuffer text = new StringBuffer();
HttpURLConnection conn = page.openConnection();
conn.connect();
InputStreamReader in = new
   InputStreamReader((InputStream) conn.getContent());
BufferedReader buff = new BufferedReader(in);
String line = buff.readLine();
while (line != null) {
    text.append(line + "\n");
    line = buff.readLine();
System.out.println(text.toString());
```

# Bài tập

Cài bặt theo giao thức HTTP để đọc nội dung trang web yahoo.com

# **Questions?**
